Should I upgrade or expand my solar panel system?

Upgrading and expanding your existing solar panel system could be your answer. When it comes to solar energy, maximizing efficiency and optimizing performance are crucial.

Can I expand my solar system?

If your solar system isn't quite meeting your electricity needs, it's almost always possible to expand your system to incorporate more panels. Adding panels to an existing system is more common than you might expect. We'll discuss why expanding your array is a great option, and we'll address the best ways to do so.

Can I add solar panels to my existing solar system?

It's relatively easy to add panels to an existing system; many of the more difficult steps, such as tying your system to the grid, will already be complete. You can explore several options for a system upgrade, depending on your available roof space and the specifications of your solar system.

Should you upgrade your solar system with a single inverter?

If you're using a single inverter, you may be limited in what panels you can use to keep your system running efficiently and smoothly. When upgrading your solar system, you're almost always better off using panels identical to those in your existing system.

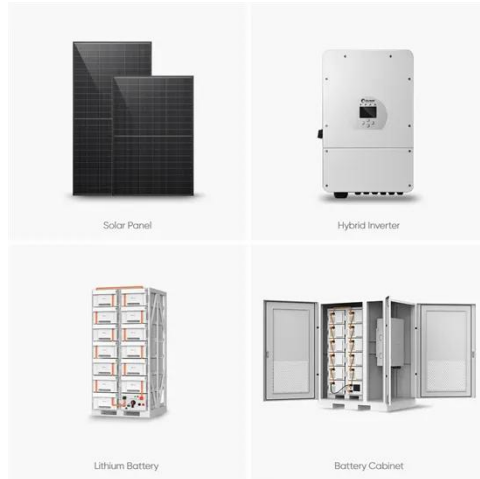

Should I add power optimizers to my solar panels?

If you are adding solar panels, this is a great opportunity to add Power Optimizers to your panels and upgrade to a SolarEdge system. There are a few reasons why you want Power Optimizers. The first is that they allow solar arrays to work together even if they're set up in different orientations.

## Do solar panels increase electricity use?

In many cases, you may see an increase in your electricity use after installing your solar panels. The thought of producing “free” electricity tends to make solar customers more relaxed about their energy use. If you start leaving your lights on more often, you may want to install more panels to account for the additional usage.
