Is it a hard requirement to have wind and solar power with storage

Overview

Can wind energy be stored on demand?

A big challenge for utilities is finding new ways to store surplus wind energy and deliver it on demand. It takes lots of energy to build wind turbines and batteries for the electric grid. But Stanford scientists have found that the global wind industry produces enough electricity to easily afford the energetic cost of building grid-scale storage.

Can wind energy be used as a storage technology?

In the study, the Stanford team considered a variety of storage technologies for the grid, including batteries and geologic systems, such as pumped hydroelectric storage. For the wind industry, the findings were very favorable. "Wind technologies generate far more energy than they consume," Dale said.

What are the advantages of wind over solar power?

One advantage of wind over solar power is that it has an enormous energy return on investment, Benson explained. "Within a few months, a wind turbine generates enough electricity to pay back all of the energy it took to build it," she said. "But some photovoltaics have an energy payback time of almost two years.

Do wind and solar farms produce electricity?

Wind and solar farms provide emissions-free energy, but only generate electricity when the wind blows or the sun shines. Surplus energy can be stored for later use, but today's electrical grid has little storage capacity, so other measures are used to balance electricity supply and demand.

Can the wind industry afford a lot of storage?

Writing in the March 19 online edition of the journal Energy & Environmental Science, Dale and his Stanford colleagues found that, from an energetic perspective, the wind industry can easily afford lots of storage, enough to

provide more than three days of uninterrupted power.

Is natural gas a safe alternative to wind & solar energy?

Everyone already knows that wind and solar energy are intermittent fuels. They must be firmed up by energy storage or fast-starting generation that ideally is also carbon-free. Most often, natural gas is used as the safety net.
