

## SolarInvert Energy Solutions

**Is it still possible to  
communicate if the earthquake  
base station is disconnected**

**LFP 48V 100Ah**

## Overview

---

Do earthquakes affect communication base stations?

Analyzing and summarizing these observed seismic damages can enhance our understanding of the impairment of communication base stations during earthquakes, providing valuable information for establishing a Bayesian network model for functionality loss.

What happens if a Tokyo earthquake hits a base station?

However, as in the case of the Noto Peninsula Earthquake, communication can be disrupted if base stations and other facilities are damaged during a disaster. Even in the event of an earthquake directly beneath the Tokyo metropolitan area, communications will most likely be interrupted by large-scale fires.

Do communication base stations perform post-earthquake functionality using Bayesian network?

A method to evaluate the post-earthquake functionality of communication base stations using Bayesian network is developed. The dependence between the equipment and its hosting building structure, and the impact of power outages are considered. The method is validated using seismic damage data from the Ludian Earthquake.

How to assess damage to mobile communication facilities during large earthquakes?

Ke et al. proposed a method for assessing damage to mobile communication facilities during large earthquakes. The study analyzed the impact of power outages and evaluated the damage caused by ground motion to base stations using fragility curves .

What happens if a communication tower is damaged in an earthquake?

In several major earthquakes, communication tower damage tends to be

relatively minor, often lacking obvious damage . However, in high-intensity areas, the apex of some mountaintop base station towers might experience bending and damage, altering or detaching antenna orientations. A few towers might even collapse.

Are communication systems paralyzed after seismic events?

Through investigations and analyses after seismic events, it has been found that communication systems experienced widespread and prolonged paralysis in affected areas.
