Large base station communication tower

Overview

What are cell towers & base stations?

Cell towers or base stations serve the same purpose that is to produce network signals for the consumers. The cells move from one tower to another depending on the coverage area or frequency. The user of the carrier receives the signals or cells from the cell towers that are generated by the base station.

What is a base station & support structure?

Base Station: Houses the radio transceivers and other equipment necessary for facilitating wireless communication between the tower and mobile devices. Support Structure: Provides the necessary height and stability to maximize coverage and signal strength. This can be a lattice tower, monopole, or guyed tower.

What is the difference between a base station and a cell tower?

The base stations are meant to improve the signal frequency and communication between interconnected devices such as computers or smartphones. On the other hand, a cell tower distributes the signals over the defined area. Some towers are power boosters that enhance the signal strength.

What is a suburban tower base station?

Suburban tower base station installations are usually located on monopole towers. These are smooth poles that look like towering street lights with foot pegs. Monopoles are more expensive and more difficult for workers to climb than lattice towers and wire-drawn masts.

How many types of base stations are there?

Macro cell, Micro cell, Pico cell and Femto cell are 4 types of base stations in wireless communication networks. Macrocell antennas must be properly

mounted on ground-based masts, rooftops or other existing structures and at heights for an unhindered, clear view of the surroundings.

What are communication towers?

Communication towers of all shapes and forms are all around us. Some towers provide multiple signals. They transmit one-way broadcasts, such as AM/FM radio and TV signals, while also handling two-way cellular communications using a variety of protocols.
