#### **Overview**

What are the core modules of a multi-energy complementary system?

For complex multi-energy complementary systems, through the establishment of a system platform for analytical processing and global optimization management, the core modules include forecasting, analysis and decision-making links, grid, renewable energy, non-renewable energy, energy storage systems, and various energy loads.

What is a multi-energy complementary system?

Multi-energy complementary systems usually include thermal power (including gas turbine), wind power, solar power (photovoltaic), hydropower, pumped storage and other types of power supply. As a conventional schedulable power source, thermal power can be adjusted to generate a certain peak amplitude, and the output speed is slow.

What is a multi-storage integrated energy system?

To address the insufficient flexibility of multi-energy coupling in the integrated energy system and the overall strategic demand of low-carbon development, a multi-storage integrated energy system architecture that includes electric storage, heat storage and hydrogen storage is established.

What is a multi-energy complementary distributed energy system (mecdes)?

Author to whom correspondence should be addressed. To improve the recovery of waste heat and avoid the problem of abandoning wind and solar energy, a multi-energy complementary distributed energy system (MECDES) is proposed, integrating waste heat and surplus electricity for hydrogen storage.

What is multi-energy thermo-chemical complementary technology?

Multi-energy thermo-chemical complementary technology refers to the selection of a suitable endothermic chemical reaction to convert thermal energy into fuel chemical energy, improve energy conversion efficiency, and

achieve renewable energy storage and transport. The technology is currently in the basic research stage.

What is energy storage technology?

Energy storage technology is the core foundation of multi-energy complementary systems to solve the mismatch between generating power and load power, the mismatch between response times of different types of power supplies.
