### Pack battery price trend

#### **Overview**

BNEF expects pack prices to decrease by \$3/kWh in 2025, based on its nearterm outlook. Looking ahead, continued investment in R&D, manufacturing process improvements, and capacity expansion across the supply chain will help improve battery technology and further reduce prices over the next decade.Why are battery prices falling?

Battery prices continue to tumble on the back of lower metal costs and increased scale, squeezing margins for manufacturers. Further price declines are expected over the next decade. From ESS News.

Why are batteries so expensive?

There are two main drivers. One is technological innovation. We're seeing multiple new battery products that have been launched that feature about 30% higher energy density and lower cost. The second driver is a continued downturn in battery metal prices. That includes lithium and cobalt, and nearly 60% of the cost of batteries is from metals.

Why are battery prices so low in China?

Companies in China faced fierce competition this year. These conditions resulted in falling battery prices and lower battery margins, forcing many battery manufacturers to enter new markets, including energy storage, while also eyeing overseas markets willing to pay more for batteries. The industry has also benefitted from low raw material prices.

Is battery production surplus a sign of a rising demand?

BloombergNEF pointed out that battery production capacity surplus is indicated by the fact that the current 3.1TWh capacity is more than double this year's demand. Regionally, China leads with the lowest average battery pack prices at \$94/kWh.

### Pack battery price trend

#### Battery price per kwh 2025, Statista

Over recent years, high-scale production and capital investment into the battery production process have made lithiumion battery packs cheaper and more efficient.
