Power station power generation specifications

Overview

What type of equipment is used in a power generation station?

Main plant equipment, such as boilers, steam turbines and generators, is custom designed to meet customers' needs. New units added to an existing power generation station will be seamlessly integrated with existing plant equipment and optimized to meet the specified requirements.

What are the station service power requirements for combustion engine generating plants?

Station service power requirements for combustion turbine and internal combustion engine generating plants are such that 208 or 480 volts will be used. 1.1.4 DISTRIBUTION SYSTEM. The primary distribution system with central in-house generation should be selected in accordance with the owner's requirements. 1.2.1 GENERAL.

What is a terminal voltage rating for a power plant generator?

Terminal voltage ratings for power plant generators depend on the size of the generators and their application. Generally, the larger the generator, the higher is the voltage. Generators for a power plant serving an installation will be in the range from 4160 volts to 13.8 kV to suit the size of the unit and primary distribution system voltage.

What are the different types of station service power systems?

Two types of station service power systems are generally in use in steam electric plants and are discussed herein. They are designated as a common bus system and a unit system. The distinction is based on the relationship between the generating unit and the auxiliary transformer supplying power for its auxiliary equipment.

What determines a station service power supply voltage?

Voltages for station service power supply within steam electric generating

stations are related to motor size and, to a lesser extent, distances of cable runs. Motor sizes for draft fans and boiler feed pumps usually control the selection of the highest station service power voltage level.

How are generator ratings selected for gas turbine generating units?

c) Generator ratings for gas turbine generating units are selected in accordance with ANSI Standards which require the generator rating to be the base capacity which, in turn, must be equal to or greater than the base rating of the turbine over a specified range of inlet temperatures.
